## ► About Us

**Mr. Ajay Kedia**

**Director,  
Kedia Advisory**

- ❑ Incorporated in 2004, Kedia Advisory is one of the leading SEBI Registered Research House having an unmatched and incomparable award winning research services with manifested pedigree of more than 15 years.
- ❑ Being a Market Leader specialising in Commodities, Equity and Currency Markets, our research and various reports including outlook and views on various products have been benefiting our clients immensely and helping them to take a better informed decision for over 15 years now.
- ❑ Mr Ajay Kedia ( Founder, Director ) has been instrumental and continues to be the guiding force since inception for setting up various processes and methodologies across various products including technical and fundamental research in making our advisory division an award winning advisory division.

# Recap

1. **Relative Strength Index** - RSI measures the magnitude of recent price changes to evaluate overbought or oversold conditions.
  - a. 70/30 Strategy
  - b. 52/48 Strategy
2. **Moving Averages** - Moving average helps smooth out the price data by creating a constantly updated average price.
  - a. Bullish Moving Average Cross
  - b. Bearish Moving Average Cross
  - c. Golden Cross
  - d. Death Cross
  - e. Strategy EMA-25,EMA-50
  - f. Strategy 7,14,21 SMA
3. **MACD** - MACD helps investors understand whether the bullish or bearish movement in the price is strengthening or weakening.
  - a. Bullish Crossover
  - b. Bearish Crossover
4. **Bollinger Band**
5. **Vortex Index**

## **Important Technical Indicators**

1. Choppiness Index
2. Supertrend
3. Directional Movement Index (DMI)
4. Fibonacci Retracement
5. Ichimoku Cloud
6. Sample Charts for Reference

# Introduction to Technical Analysis

## Open Interest

- Open interest is the total number of outstanding derivative contracts, such as options or futures that have not been settled.
- Open interest equals the total number of bought or sold contracts, not the total of both added together.
- Open interest is commonly associated with the futures and options markets.
- Increasing open interest represents new or additional money coming into the market while decreasing open interest indicates money flowing out of the market.

Identify Market Interpretation Using Price Volume & Open Interest						
Price		Volume		Open Interest		Interpretation
	Rising		Rising		Rising	A. Strong B. Bullish C. Price Continue to Rise
	Rising		Falling		Falling	A. Weakening B. Moderately Bearish C. Current Uptrend is Weakening
	Falling		Rising		Rising	A. Weak B. Bearish C. Downtrend is Continues
	Falling		Falling		Falling	A. Strengthening B. Moderately Bullish C. Current Downtrend Weakening

- Price increasing during an uptrend and open interest on the rise are interpreted as new money coming into the market. That reflects new buying, which is considered bullish.
- If the price is rising and the open interest is on the decline, short sellers covering their positions are causing the rally. Money is, therefore, leaving the marketplace. This is taken as a bearish sign.
- If prices are in a downtrend and open interest is on the rise, it suggests new money is coming into the market. This shows aggressive new short selling. They believe this scenario will lead to a continuation of a downtrend and a bearish condition.
- Suppose the total open interest is falling off and prices are declining. This scenario suggests weakening of downtrend and start of strong position as most of the sellers have sold their positions.

KEDIA STOCKS AND COMMODITIES RESEARCH PVT LTD

SEBI REGISTRATION NUMBER - INH000006156

# Choppiness Index

- The Choppiness Index (CHOP) is an indicator designed to determine if the market is choppy (trading sideways) or not choppy (trading within a trend in either direction).
- It is a range-bound oscillator, The Choppiness Index has values that always fall within a certain range. CHOP produces values that operate between 0 and 100.
- Choppiness Index is not meant to predict future market direction, it is a metric to be used to for defining the market's trendiness only.
- The closer the value is to 100, the higher the choppiness (sideways movement) levels.
- The closer the value is to 0, the stronger the market is trending (directional movement)
- Common threshold values are popular Fibonacci Retracements. 61.8 for the high threshold and 38.2 for the lower threshold.

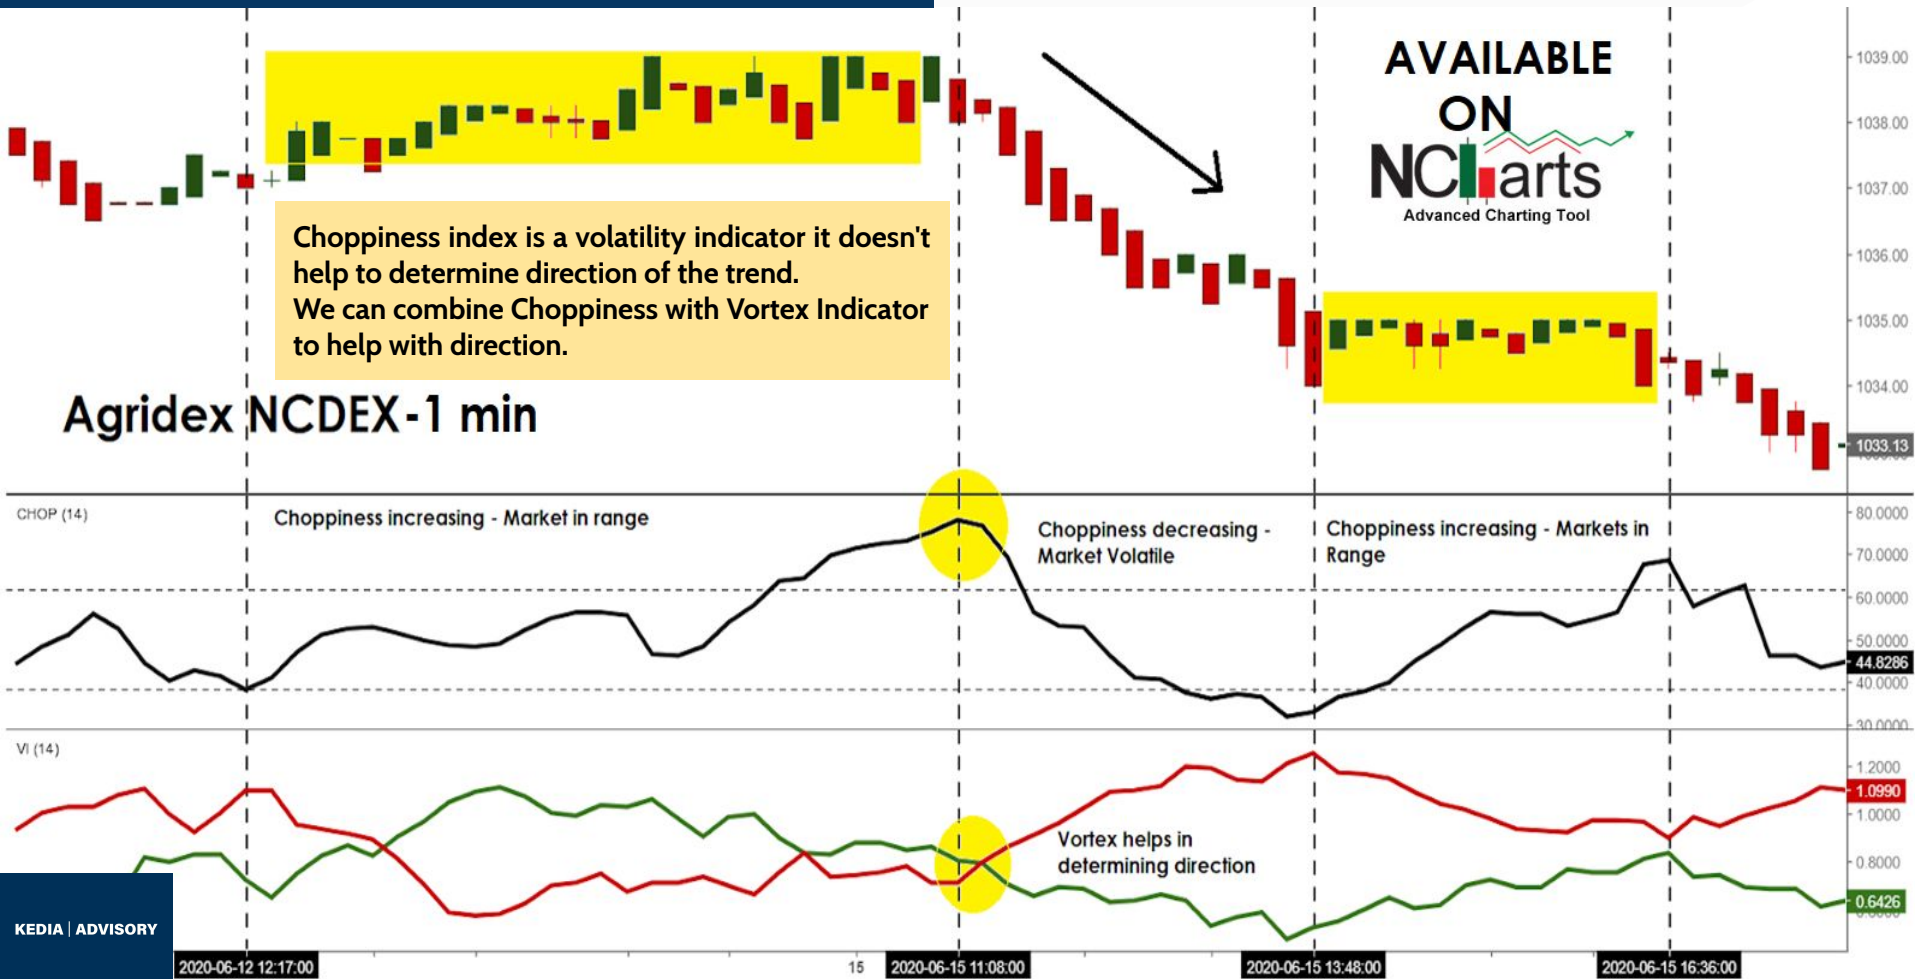

# Choppiness Index

# Trading Idea- Choppiness and Vortex

## Choppiness Index

# Trading Idea- Choppiness and RSI

## Choppiness Index

## Directional Movement Index (DMI)

- The Directional Movement Index (DMI) is composed of two lines, and an optional one, showing selling pressure (-DI), showing buying pressure (+DI), and a ADX line showing the difference between the former positive and negative lines.
- A +DI line above the -DI line means there is more upward movement than downward movement.
- A -DI line above the +DI line means there is more downward movement than upward movement.
- Crossovers can be used to signal emerging trends. For example, the +DI crossing above the -DI may signal the start of an uptrend in price.
- The larger the spread between the two lines, the stronger the price trend.

# SUPER TREND INDICATOR

- Supertrend is a trend indicator.
- When the Supertrend closes below the Price, a Buy signal is generated, and when the Supertrend closes above the Price, a Sell signal is generated.
- Supertrend is constructed using the ATR (Average True Range) indicator with a multiplier and has two inputs - ATR period and the multiplier.
- Generally used parameters are 10 and 3

# Fibonacci Numbers

- Fibonacci retracements are one of the four most commonly-used Fibonacci studies for **predicting** levels of support and resistance for a given market.
- **Fibonacci retracements** are used immediately after a strong price movement either up or down.
- An imaginary vertical line is drawn across the chart between two extreme price values, one high and one low.
- The most common number of lines is five, drawn at 0%, 38.2%, 50%, 61.8%, and 100% of the length of the line
- A Fibonacci retracement isn't useful for determining overall trends in price, but can help to **predict levels of support and resistance** within a large price reversal

## Types of Fibonacci

**Retracement:** From the swing XA, a Fibonacci ratio is retraced to B.

**Extension:** From the swing XA, more than 100% of the swing XA is extended from A to B.

**Projection:** From the swing XA, a retracement is made to form the AB leg. From B, the swing XA is projected from B to C.

**Expansion:** From the swing XA, a retracement is made to B to form AB. A projection is plotted from A in the same direction and length of XA to C.

# Let's get to our Strategy for the day - ICHIMOKU CLOUD

## Ichimoku Cloud Components and Calculations

1. The **RED LINE** in Figure 1 is Tenkan-Sen (**Conversion Line**). It's the midpoint of the last nine price bars:  $[(9\text{-period high} + 9\text{-period low})/2]$ .
2. The **BLUE LINE** is Kijun-sen (**Base Line**). It's the midpoint of the last 26 price bars:  $[(26\text{-period high} + 26\text{-period low})/2]$ .

**PRESENT**

3. The **GREEN LINE** is Senkou Span A (**Leading Span A**). It's the midpoint of the above two lines:  $[(\text{Conversion Line} + \text{Base Line})/2]$ . This value is plotted 26 periods into the future.

4. The **RED LINE** is Senkou Span B (**Leading Span B**). It's the midpoint of the last 52 price bars:  $[(52\text{-period high} + 52\text{-period low})/2]$ . This value is plotted 26 periods into the future.

**FUTURE CLOUD**

5. The **GREEN LINE** is the Chickou Span (**Lagging Span**), and will always lag behind the price; it's the most recent price, plotted 26 periods back.

# Some FAQs on Technicals

**How to use technical analysis to make profit in markets?** If you love taking signals from what others are doing, technical analysis may prove to be a good way to make profits in markets. By using technical indicators, technical analysis of stocks, commodities and currencies uses patterns in market data so as to identify trends and then make predictions.

**How do you learn technical analysis of stocks?** You can learn technical analysis by reading good books, reading articles and blogs on the Internet. do virtual trading to learn from mistakes. Avoid trading in penny stocks at first. They are high risk, high return game, Follow top technical analysts.

**What are the limitations of technical analysis?** Technical analysis and technical charts are based on a theory. If the indicators give mixed signals, there is indecision. In such a scenario, one indicator could show a buy signal. At the same time, the other technical indicator could show a sell signal.

**What are the assumptions in technical analysis?** Technical markets experts believe that the security/stock price will move along an established trend and pattern. Yes, they think it will behave just as it had done in the past. We also admit that history does not repeat itself. If you are basis trades on some technical analysis in intraday, be prepared to witness something which has not happened in the past.

**What is Breakout?** It is whereby prices forcefully penetrate an area of prior support or resistance. If you are interested in trading in only indices, look for breakouts in Nifty technical chart.

**What are the different uses of technical analysis?** There is only one basic use of technical analysis - to get entry and exit information to make a successful trade. All the technical analysis and technical indicators are used to confirm other technical analysis tools. Technical analysis gives you very short term indicators of how a stock/index may move. Thus, it is fit for traders.

**What are trend lines?** Technical analysis is built on the assumption that prices trend. Hence, the use of trend lines is important for both trend identification and trend confirmation. A trend line is a straight line. It connects two or more price points and then extends into the future to act as a line of support or resistance. Trend lines are extremely useful for technical analysis of stocks.

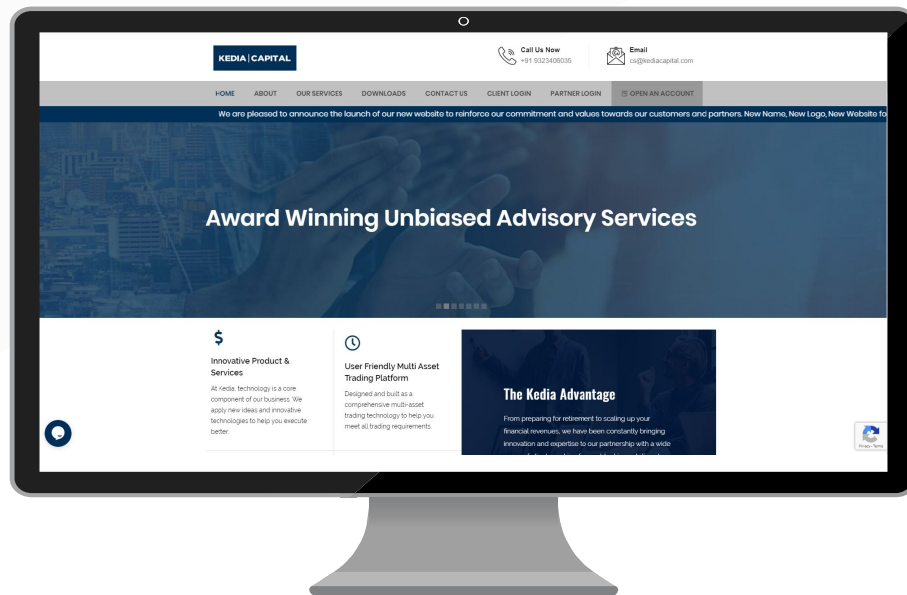

**What is the concept of support and resistance?** The support and resistance are basically specific price points on a chart. These points are expected to attract maximum amount of buying or selling. The support price in technical analysis is a price at which one can expect more buyers than sellers. In the technical market, the resistance price is a price at which one can anticipate more sellers than buyers.

**What is the importance of volume in technical analysis?** In the technical analysis world, volume measures the number of a stock's shares that are traded in a day or a period of time. Volume is very important because it confirms the previously-decided trend directions. Volume is a key input. Look at both price and volume when you study stock charts.
